

PaperFlow

Question papers that set themselves, and practice that comes from each student's own mistakes.

Thank you for testing PaperFlow. This guide walks you through the whole website as the four kinds of people who use it: a **teacher**, a **student**, the **institute's owner**, and **us** (the people who run PaperFlow and look after the question bank).

For each part it tells you **what to try** and **why that feature exists**. What we most want is your honest opinion: what is useful, what is confusing, what is missing, and what your teachers and students would actually use.

You will need

- The **website link** that Sanskar sent you with this guide.
- A computer, for the teacher and owner parts.
- A phone, for the student part. A computer works too, but students will use phones.
- About **60–90 minutes**. You can stop and come back whenever you like.

Everything here is practice data. You cannot break anything.

The three coaching institutes, the teachers, the students and their marks are all made up. Click freely, create things, delete things, and try to confuse it. If something goes wrong, that is a useful finding, not a problem.

Contents

| 7 | As PaperFlow itself: reviewing questions (optional) |
| 8 | Your feedback |

What PaperFlow does

The problem it solves, and the loop that runs every time a test is written.

For teachers: setting a good test takes hours. PaperFlow makes a complete, balanced paper in seconds from a **checked question bank**. The teacher picks the chapters and the type of paper. The paper follows the marks pattern, spreads easy, medium and hard questions sensibly, and comes with answer keys. It can print **several versions (sets)** of the same paper so that neighbours cannot copy.

For students: after a test, a student opens PaperFlow on their phone and taps the questions they got wrong. That takes under a minute. PaperFlow then gives them a **practice set**: fresh questions on exactly those topics, at a similar level, that they have not seen before. Over several tests it builds a picture of their **weak spots**.

The loop:

The four kinds of people

Teacher

Sets papers, prints them, makes batches (class groups), and sees who has logged each test.

Student

Joins a batch with a code, logs tests, practises, and sees their weak spots. Uses a phone.

Institute owner

Runs the coaching centre's account: who is a teacher or student, which subjects each teacher teaches, and which subjects the centre uses.

PaperFlow (us)

Look after the shared question bank. Every question is checked by a person before it can reach a paper.

Two things worth knowing before you start

- **Each institute is private.** One coaching centre can never see another's students, papers or marks. You will see three pretend centres: *Sunrise*, *Riverside* and *Hilltop*.
- **The questions are samples.** The Class 10 Maths questions are real maths with correct answers, but they are machine-made examples to show how things work, not the final question bank. Judge the *website*, and tell us separately if the question style is off.

Signing in: the test accounts

There is a ready-made account for every kind of person. They all use the same password.

Password for every test account:

staging-maths-2026

SIGN IN AS	WHO THIS IS	USED IN
<code>sunrise.teacher1</code>	Maths teacher at Sunrise Academy	Part 3
<code>sunrise.student7</code>	Student with a test still to log	Part 4
<code>sunrise.student1</code>	Student who has logged both tests	Part 4
<code>sunrise.admin</code>	Owner of Sunrise Academy	Parts 5 and 6
<code>riverside.teacher1</code>	Maths teacher at a <i>different</i> centre	Part 5 (privacy check)

There are more if you want them: `sunrise.teacher2`, `sunrise.teacher3` (teaches Class 12 Biology), `sunrise.student1` to `sunrise.student24`, and the same pattern for `riverside.` and `hilltop.`

How to sign in

1. Open the website link. You will see the sign-in page.
2. Type the **username** exactly as above, including the dot, and the password.
3. To switch person: at the bottom of the left-hand menu (or under **Me** on the student app), **Sign out**, then sign in as someone else.

Tip: be two people at once

Open a **private / incognito window** (Chrome: **Ctrl + Shift + N**). A private window keeps a separate sign-in, so you can be the teacher in one window and the owner or a student in the other.

Known issue: speed

Pages can take a few seconds to open. This test site runs on a free server far away, and we are already working on speed. Please note it only if something feels *unusably* slow, or never finishes.

As a teacher

3a. Set a paper (left menu → Set a paper)

Why it exists: this is the heart of PaperFlow, a whole balanced paper with answers in seconds instead of hours.

- ☐ Under **Class and subject**, choose **Class 10 · Mathematics**.
A teacher only sees the subjects the institute has assigned to them.
- ☐ Tick a few **Chapters to cover**, e.g. Real Numbers, Polynomials, Quadratic Equations.
- ☐ For the **pattern** (the paper's marks structure), choose **Staging Unit Test (25 marks)**.
A pattern says how many questions of each kind: 1-mark, 2-mark, 5-mark and so on. Real CBSE board patterns will come with the real bank.
- ☐ Try the **Difficulty mix** (how much is easy, medium or hard) and set **Printed sets to 2**.
- ☐ A full paper appears on the right. Check that the maths symbols (fractions, powers, $\sqrt{\quad}$, π) **display properly**.
- ☐ **Swap** a question you don't like (the $\rightleftharpoons$ button beside it).
It is replaced by another with the same marks, chapter and difficulty, so the paper stays balanced.
- ☐ **Lock** a question you like, then press **Generate a different paper**.
Locked questions stay; everything else changes. It's a quick way to keep the good bits.
- ☐ **Flag** any question as wrong or badly worded (the flag button), and write a short reason.
That question is pulled from everyone's papers until we have checked it. One teacher's report protects every centre. It then appears under **Flagged questions** in the menu, where it can be withdrawn.
- ☐ Press **Save and print**. Give the paper a name and pick a batch.
- ☐ On the print page, check you get each set on its own pages, **answer keys** for each set, and a sheet showing which question in Set A is which question in Set B.
Sets stop copying. The mapping sheet lets a teacher mark any set with one key in mind.
- ☐ If a setting is impossible (for example too few chapters for the pattern), read the message you get. Does it tell you clearly what to change?

3b. My papers (left menu → My papers)

Why it exists: reprint any old paper exactly, and see which students have logged it.

- ☐ Open **Staging Unit Test 1**. You see the marks, the sets, and **who logged, and which set they wrote**.
- ☐ If a student chose the wrong set when logging, the teacher can correct it here and their practice rebuilds. Look for that control.
- ☐ **Print everything** again: it should be exactly the same paper as before.

3c. Batches (left menu → Batches)

Why it exists: a batch is a class group. Students join by typing a short code, with no lists to type in.

- ☐ Find the 6-character **join code** of **10-Mathematics A**. **Write it down:** you need it in Part 6.
- ☐ Create a new batch. It gets its own code straight away.
- ☐ Try **rotating** a code, e.g. if it was shared too widely. The old code stops working.

As a student

Why it exists: most students never look at a marked test again. PaperFlow turns each test into targeted practice while the mistakes are fresh.

4a. Log a test

- ☐ The home screen lists the batch's tests. **Staging Unit Test 1** says it **needs logging**. Open it.
- ☐ **Which set did you write?** Pick one.
Each set has the questions in a different order, so the app must know which one the student had.
- ☐ It asks **"Is this question 1 on your sheet?"** and shows it. Confirm.
A quick check that the student picked the right set, before they mark anything.
- ☐ Tap three or four questions as **wrong**.
- ☐ Press **Save and build my practice set**. Was it quick and obvious? Would a 15-year-old manage it without help?

4b. Practice (Practice tab)

- ☐ A practice set is waiting: new questions on the same topics, none seen before.
- ☐ Try a question, then open its **solution**.
Solutions unlock as the student works, so they try first instead of reading the answer.

4c. Weak spots (Weak spots tab)

- ☐ For a fuller picture, sign out and sign in as `sunrise.student1`, who has logged both tests. Weak spots lists the topics they keep getting wrong.
Deliberately no score, percentage or rank. It's a to-do list, not a report card. Do you agree with that choice?

4d. Me, and the app on the phone

- ☐ **Me** shows the student's batches, a box to **enter a join code**, and **change password**.
- ☐ On Android Chrome, open the site a second time: Chrome should offer to **Install PaperFlow**. Install it: it opens like a normal app.
- ☐ Turn on **airplane mode** and open the app. Tests you've already opened should still show, and trying to log should say clearly that it needs internet, **without losing what you marked**.

Questions to think about as a student

Is anything written in words a student would not understand? Is there anything a student would want that isn't there, such as their marks, the teacher's comments or a reminder?

As the institute owner

Why it exists: the coaching centre controls its own people and data. The owner cannot change the questions themselves, so the question bank stays trustworthy for everyone.

5a. Overview

- ☐ A summary of teachers, students, batches and papers. Is this the information an owner wants first?

5b. Members

- ☐ Everyone at Sunrise is listed with their username and role. Try **Filter by role**.
- ☐ **Reset password** for a student. You get a new temporary password, shown once, to pass on.
Students forget passwords constantly. The owner can fix it without contacting us.
- ☐ Change someone between **teacher** and **student**, then check **Recent role changes** records it.
- ☐ Look at **Invite someone**: you invite a person by their username.

5c. Teacher subjects

- ☐ Tick or untick which teacher teaches which subject.
A teacher can only set papers and make batches for their own subjects.

5d. Subjects

- ☐ Every class and subject is listed, including ones Sunrise can't use yet, **with the reason** (for example, "being reviewed now").
A subject is only switched on once the shared bank has enough checked questions for every chapter. That way a teacher never gets a thin or lopsided paper.
- ☐ **Request** a subject that isn't active. We see the request on our side.

5e. Export data

- ☐ One click downloads everything the institute owns.
The centre's data is theirs. They can take it with them at any time.

5f. Privacy check

- ☐ In a private window, sign in as `riverside.teacher1`. Confirm that **nothing** from Sunrise appears: no students, batches, papers or private questions.

How a new person joins

Anyone can make an account, but a new account can't see anything until the institute lets them in.

Why it works this way

Nobody can make themselves a teacher. A new account belongs to no institute, so a stranger with the link sees nothing. There are two ways in: a **student** types a batch's join code, or anyone **asks the institute** and the owner decides what role they get.

6a. A new teacher asks to join

- ☐ Sign out. On the sign-in page, choose **Create an account**. Use your own name and make up a username, e.g. `aman.test`, and a password.
- ☐ You land on a welcome page: you're signed in, but not in any institute yet. Is that page clear?
- ☐ Ask **Staging Sunrise Academy** for access, with a note like *"Maths teacher, joining Monday"*.
- ☐ In another window, sign in as `sunrise.admin`. A notice says someone is asking to join. **Review** it, then **Approve as Teacher**.
- ☐ Back in your new account, refresh: you're now in the teacher console.

6b. A new student joins with a code

- ☐ Create another account, e.g. `aman.student`.
- ☐ On the welcome page, type the **join code** you wrote down in 3c. You go straight into the student app, in that batch.

6c. Things to try to break

- ☐ A wrong join code, a username that's already taken, a password that's too short. Are the messages clear?
- ☐ As `sunrise.admin`, **decline** a request. What does the person see?

As PaperFlow itself

The side only we use: looking after the shared question bank.

This part needs your own account to be given our access. **Send Sanskar the username you made in Part 6** (e.g. `aman.test`) and he'll switch it on. Then sign in with it and choose **Platform console**.

- ☐ **Review queue:** new questions wait here. Each is checked, mainly "*does the answer match the question?*", and approved or rejected.
No question reaches a paper without a person checking it. A wrong answer key in front of a parent is the worst thing that could happen.
- ☐ **Activation:** each subject shows whether the bank is thick enough to switch on. Class 10 Maths passes; Class 10 Science deliberately doesn't.
- ☐ **Institutes:** the three centres, with their size.
- ☐ **Access requests** and **Subject requests:** people asking to join, and centres asking for a subject. Riverside has asked for Science.
- ☐ **Support:** look up a person (e.g. `sunrise.student1`) and reset their password.
- ☐ **Health** and **Audit log:** how full the free server is, and a record of every time we looked at an institute's data.
We can see institutes' data to help them, but every look is recorded.

Your feedback

Write in the boxes, send a voice note, or message screenshots, whatever is easiest for you.

When something looks wrong, a screenshot plus one line is perfect

For example: *"Logged in as sunrise.teacher1, Set a paper, pressed Save and print, nothing happened."*

Please say **which account** you were using.

PART

WORKED? • CONFUSING? • MISSING?

3. Setting and printing a paper

3. Batches and join codes

4. Logging a test (student)

4. Practice and weak spots

5. Institute owner's pages

6. Joining (account, request, code)

7. Question review (if you tried it)

The bigger questions

Would your teachers use **Set a paper** instead of making papers by hand?
What would stop them?

Would students actually **log their tests**? What would make them do it?

What is the **one thing missing** that you'd need before using this for real?

Anything that felt **unnecessary** or too complicated?

How do the **questions** look: style, difficulty, how the maths is shown?

Thank you. Every note here goes straight into the next version.
